Şişli

solid ground, secure future!

Taşıyapı Şişli, located in Istanbul's seismic zone, has been engineered with the highest structural standards. The structural core, built with C50 grade concrete and a high-strength reinforcement system, is supported by damping technologies tested for earthquakes up to magnitude 9.5.

From soil surveys to column placement, every step has been developed in accordance with AFAD and international seismic regulations. Each layer is equipped with modern isolation technologies that absorb and distribute energy — ensuring not only structural integrity, but also the safety and comfort of those inside.

Safety at Every Level

Every construction detail reflects the harmony of architectural aesthetics and engineering discipline.

From column insulation to the materials used and application techniques, every stage is meticulously monitored and controlled.

Taşıyapı Şişli offers its residents not just a home, but
"a secure future to live in."
